Implement an enterprise security policy (MP6).

Enterprise security vs. home security, what's the difference?

In the previous mission plans you have learned about personal security at home. Home security has many similarities to enterprise security. Whether you operate a computer at home or at work, the potential for an attack exists in either place. It is more crucial, however, for an enterprise to stay clear of attacks for the simple reason that they cannot afford not to.

After completion of this mission plan, you should be able to:

- Define business continuity.
- Explain how redundancy planning and disaster recover planning benefit an organization.
- Explain what a security policy is and how it is used.
- List the different types of security policies.
